

I oppose the unlicensed use of the 420 - 450 MHz band for RFID transmitters as proposed. I believe that if the FCC permits this use we will experience unprecedented interference in the Government, Amateur as well as cable television and cellular telephone services. This use is more appropriate in the Industrial, Scientific and Medical frequencies and even there, it must be licensed to prevent improper use. As an alternative, the technology and infrastructure for two way communication with remote digital devices is already licensed and in use in the 929 - 940 MHz bands (two way paging). Much capacity exists in that band and the petitioner should be required to purchase a license or cooperate with existing licensees and should not be permitted to duplicate existing technology on a frequency which is currently serving other uses.
